Instruction

1. Turning on the engine

In order for the engine to run in the background the batch (BatchLeadAssessment) must be scheduled

One-time manual step that is needed to run the engine is to execute this code:

```
System.schedule(  
    Utils.BATCH_LEAD_ASSESSMENT_SCHEDULER,  
    LeadAssessmentService.getNextScheduleExecutionTime(),  
    new BatchLeadAssessmentScheduler()  
);
```

After Batch completes, each next execution is delayed by the settings in the CustomMetadata (Lead_Assessment_Delay.Configuration)

Minimum delay should be 1 minute in order the Schedule to start

1. Simple queries

Simple queries are queries that are describing a specific field in *Query Piece* field
Implementation requires filling out the proper Lead object field API Name

2. Complex queries

Complex query allows user to create any query related to the Lead record
In order to connect complex query with a lead field [field] notation is needed
Example:

Edit QUERY-007

Lead Assessment Query Name
QUERY-007

* Condition Name

Is Existing Customer VIP by Email And Phone

Owner
 Ryszard Rogalski

Query Piece 

```
SELECT Id FROM Account WHERE
VIP_Siebel_Id__c != null AND
IsPersonAccount = TRUE AND
Customer_Class__c IN ('VIP Client', 'Active', 'VIP Active',
'Potential') AND (PersonEmail = [Email] AND
PersonMobilePhone = [Mobile_new__c])
```

Created By
 Ryszard Rogalski, 31.8.2021 11:23

Last Modified By
 Ryszard Rogalski, 2.9.2021 10:22

Cancel
Save & New
Save

[Field] notation allows the engine to treat these values as a Merge field using Lead's fields

```
PersonEmail = [Email] AND PersonMobilePhone = [Mobile_new__c])
```

3. Verification

After creating *queries* and *conditions*, remember to verify them with 'Verify Queries' button.

'Verify Queries' button invokes the SOQL queries directly to the database, so validation is not executed by the engine, but by the Salesforce itself.

5. Lead Assessment Engine actions

In order to execute Lead Assessment Actions, the following conditions must be satisfied:

- Lead must be qualified by at least **one** *Lead Assessment Rule*

(Lead is qualified by *Lead Assessment Rule* whenever **all** *Lead Assessment Conditions* are satisfied under this specific *Lead Assessment Rule*)

6. Lead Assessment Endpoint request

Currently, the engine is not only executing *Lead Assessment Actions* configured under the specific *Lead Assessment Rule*. It is also executing the callout request to the Azure.

Actions specified after *Lead Assessment Qualification* by the *Lead Assessment Rules* are written under the `executePostAssessmentLogic` method inside `LeadAssessmentService` class.

It is responsible for executing *Lead Assessment Actions* under specific *Lead Assessment Rule*, which is qualifying the lead and executing `synchronizeWithLeadDistributor` method.

7. Engine's synchronization with Lead Distributor

As described in paragraph no. 6, after Lead is qualified by *Lead Assessment Conditions* under a specific *Lead Assessment Rule* - its data is synchronized with a Lead Distributor.

Configuration of the Lead Distributor callout is configured in the custom metadata

```
Azure_B2C_Lead_Integration_Fields.Configuration
```

[Edit](#)[Delete](#)[Clone](#)

Whenever a change is required in the endpoint callout, there is a modification needed in the Custom Metadata, as well as in the `LeadAssessmentService` class - `LeadAzureIntegrationWrapper` class.

`LeadAzureIntegrationWrapper` is required since Azure endpoint fields may be arrays, and then Developer should specify this value in the `LeadAzureIntegrationWrapper` class and initialize it as a list.

```

public boolean isColdLead() {get;set;}

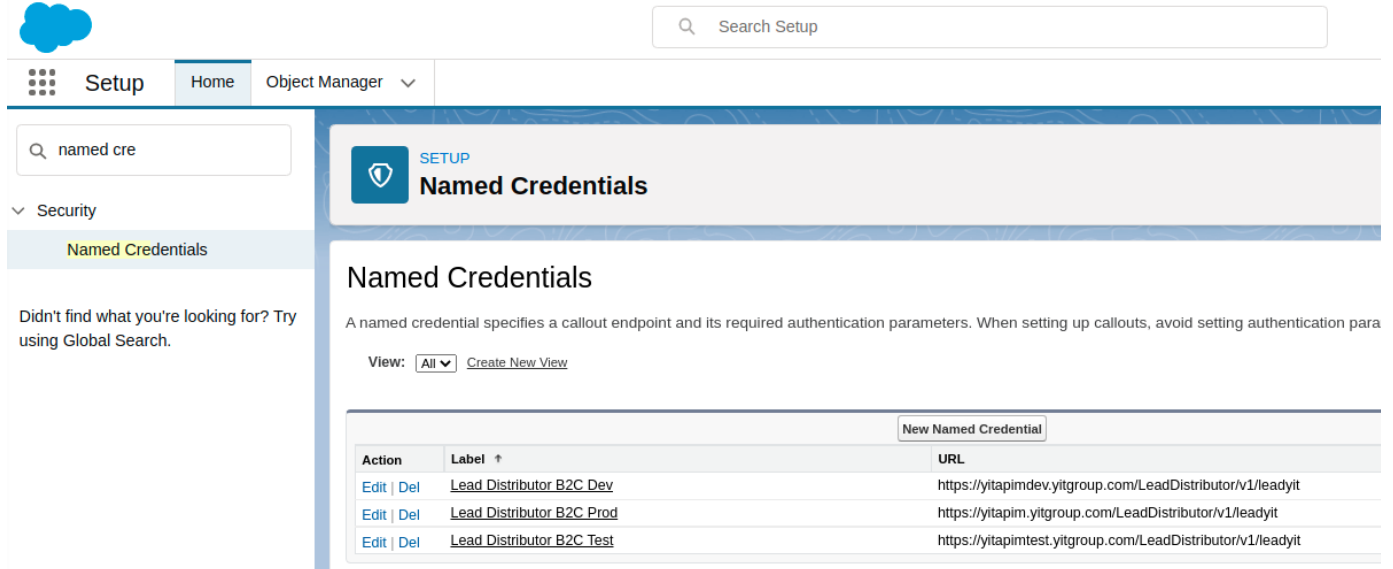

public LeadAzureIntegrationWrapper(){
    this.isColdLead = false;
    this.channel = Utils.COLD_LEAD_NURTURING_AZURE;
    this.projectBusinessSegment = 'Housing';
    this.countryInterface = Utils.COUNTRY_CODE_FI; //ISO 639-1 two-letter country code
    this.initializeLists();
}

public void initializeLists(){
    this.localities = new List<String>();
    this.districts = new List<String>();
    this.areaMarketingNames = new List<String>();
    this.projectNames = new List<String>();
}

```

8. Azure Lead Distributor authorization - Salesforce Named Credentials

Salesforce stores Azure Lead Distributor keys under the Named Credentials

The screenshot shows the Salesforce Setup interface. The left sidebar has a search bar with "named cre" and a "Security" section expanded, showing "Named Credentials". The main content area is titled "Named Credentials" and includes a description: "A named credential specifies a callout endpoint and its required authentication parameters. When setting up callouts, avoid setting authentication parameters." Below this is a "View:" dropdown set to "All" and a "Create New View" link. A table lists three named credentials:

Action	Label ↑	URL
Edit Del	Lead Distributor B2C Dev	https://yitapimdev.yitgroup.com/LeadDistributor/v1/leadyit
Edit Del	Lead Distributor B2C Prod	https://yitapim.yitgroup.com/LeadDistributor/v1/leadyit
Edit Del	Lead Distributor B2C Test	https://yitapimtest.yitgroup.com/LeadDistributor/v1/leadyit

If modification of keys/urls are needed it should be done under this Named Credentials

Named Credential choice in the engine is based on the Sandbox Type in the `getLeadDistributorEndpoint` method of `LeadAssessmentService` class

```

public static String getLeadDistributorEndpoint() {
    String orgType = UTILS.getOrgType();
    if(orgType == Utils.DEVELOPER){
        return Utils.LEAD_DISTRIBUTOR_DEV_CREDENTIAL;
    }else if(orgType == UTILS.DEVELOPER_PRO){
        return Utils.LEAD_DISTRIBUTOR_DEV_CREDENTIAL;
    }else if(orgType == UTILS.PARTIAL_COPY){
        return Utils.LEAD_DISTRIBUTOR_UAT_CREDENTIAL;
    }else if(orgType == UTILS.FULL_COPY){
        return Utils.LEAD_DISTRIBUTOR_UAT_CREDENTIAL;
    }else if(orgType == UTILS.PRODUCTION){
        return Utils.LEAD_DISTRIBUTOR_PROD_CREDENTIAL;
    }else{
        return null;
    }
}

```

For the *Salesforce Production* - Lead Distributor B2C *Prod* named Credential will be used.

For the *Salesforce Sandbox FullCopy/PartialCopy* - Lead Distributor B2C *Test* named Credential will be used.

For the *Salesforce Sandbox Developer/DeveloperPro* - Lead Distributor B2C *Dev* named Credential will be used.

8. Salesforce's deployment package/files

workbench.developerforce.com

Tests needed to be run during the deployment on Production:

- LeadAssessmentServiceTest
- UtilsTest
